

DID YOU KNOW?

Volatile organic drinking water contaminants are routinely measured at $\frac{1}{2}$ - 1 part per billion. This is the same as an inch in 16,000 miles, or one postage stamp on 160 acres! (Pretty small, huh?)

People need about 2 $\frac{1}{2}$ quarts of water a day (from eating or drinking) to maintain good health. A person can live without water for about one week, depending on the conditions. (AWWA)
